

HFC – BIOMASS FOR ENERGY

1. Eliminate primary forest biomass from the list of renewable electricity sources.
2. Accept that science has demonstrated that using forest biomass to generate electricity is inefficient and emits more CO₂ than coal per unit of electricity when burnt. Because of the slow regrowth of our forests, using forest biomass for electricity has net CO₂ emissions for over 40 years. We need to reduce CO₂ emissions now!
3. Prohibit further construction of forest biomass electricity facilities and decommission existing facilities, as Nova Scotia Power (NSP) produces cheaper forms of legitimately green energy.
